← Back to Rolling Stock

Taipei-region metro fleet roster

An evidence-weighted roster of Taipei and New Taipei metro vehicle families, procurement lots, partial identifiers and known renewal work.

TAIPEI-REGION METRO FLEET ROSTER				
SCOPE TRTC [/rail/operators/trtc/] high-capacity and Wenhu fleets; NTMC [/rail/operators/ntmc/] current fleets [1]	ROSTER GRAIN Family and procurement lot, not individual set [2]	INDIVIDUAL IDENTIFIERS Partial; only the ranges and examples published by primary sources are shown [2]	CURRENT DEPOT ALLOCATION TBC at unit level	WITHDRAWAL AND PRESERVATION TBC at unit level

What the evidence supports

The public primary record is strong at the fleet-family level. DORTS gives the C301 [/rail/metro/rolling-stock/c301/], C321 [/rail/metro/rolling-stock/c321/], C341 [/rail/metro/rolling-stock/c341/], C371 [/rail/metro/rolling-stock/c371/] and C381 [/rail/metro/rolling-stock/c381/] procurement scopes, while the DORTS technical series and manufacturer pages add builder, production, delivery and partial car-number information. [3] [4] [5] [6] [7] [8] [9] [10] The same pattern holds for Wenhu: DORTS documents the 51 VAL 256 [/rail/metro/rolling-stock/val256/] pairs and 101 C370 [/rail/metro/rolling-stock/innovia-apm-256-c370/] married pairs, and TRTC [/rail/operators/trtc/] records when the converted VAL pairs joined the line. [11] [12]

The table deliberately preserves procurement lots rather than flattening them into one number. C381 has a 23-train base order and a separate one-train Dingpu add-on, while Taiwan Rolling Stock's page describes only its own 96-car and six-car production share. [8] [10] C371 likewise has a family total and a separately identified domestic-production subset. [6] [7] Those are different questions, so the table keeps both values.

FLEET FAMILY OR LOT	KNOWN IDENTIFIERS AND QUANTITY	BUILDER OR PRODUCTION EVIDENCE	DELIVERY / FIRST-SERVICE EVIDENCE	LINE AND DEPOT
VAL 256	51 pairs / 102 cars; no complete public pair-number register. [11]	Matra; manufactured in 1991. [11]	First service 28 March 1996; all 51 converted pairs joined Wenhu service on 26 December 2010. [11] [12]	Wenhu fleet; cu pair-to-depot assignment TBC describes the W depots by funct by pair. [19]
C370 / Bombardier Innovia APM	101 married pairs / 202 cars; no complete public pair-number register. [11]	Bombardier system; DORTS records 100 cars assembled in Pittsburgh and 102 by Tang Eng. [11]	Passenger service with the Neihu [/rail/metro/stations/br19/] extension on 4 July 2009. [11]	Wenhu fleet; cu pair-to-depot assignment TBC
C301	22 six-car trains / 132 cars; prototype EMU 01/02 is the named example. [3]	Union Rail Car Partnership; all cars reached Beitou [/rail/metro/stations/r22/] by November 1995. [3]	Passenger service began 28 March 1997. [3]	Tamsui [/rail/m ions/r28/] Line procurement co Beitou was the delivery/test site proof of every c set's depot. [3] [
C321	36 six-car trains / 216 cars; DORTS identifies cars 155 and 156 in the derailment record, not a full set register. [4]	Siemens; three procurement lots CH321 (11), CN331 (17) and CC361 (8). [4]	Lot-level delivery dates were not found in the opened primary pages; TBC.	Historical Xindia l/metro/stations 1/]/Nangang/Ba onghe [/rail/me ions/y12/] grouf line and depot a TBC because hi capacity depots mutually usable
C341	6 six-car trains / 36 cars; no full public train-number list. [5]	Siemens; manufactured 2003. [5]	Delivered September–November 2004 for the Tucheng [/rail/metro/stations/bl03/] opening. [5]	Historical Bannan/Tuchen procurement co current line and allocation TBC.

FLEET FAMILY OR LOT	KNOWN IDENTIFIERS AND QUANTITY	BUILDER OR PRODUCTION EVIDENCE	DELIVERY / FIRST-SERVICE EVIDENCE	LINE AND DEPOT
C371 family	52 six-car + 3 three-car trains / 321 cars; Taiwan Rolling Stock's identified subset is cars 401–418 and 431–466, 162 cars.[6] [7]	Kawasaki family; Taiwan Rolling Stock's subset completed January 2010.[7]	Exact unit-level entry dates and current set assignments TBC.[6] [19]	Procurement his includes Xinzhu il/metro/station 8/]/Luzhou [/ra stations/o54/] a high-capacity lo current line and allocation TBC.
C381 family	23 base trains (13 CR381 + 10 CG391) plus one six-car Dingpu add-on; Taiwan-built identifiers 515–546 (96 cars) and 547–548 (six cars).[8] [10]	Kawasaki system contract; Taiwan Rolling Stock production share documented separately.[8] [10]	CR381 trains 1–6 arrived May–August 2010, train 7 in September 2011, trains 8–13 April–July 2012; handover October 2012, acceptance August 2013.[9]	Xinyi/Songshan etro/stations/g1 9/]/Dingpu proc contexts; curren and depot alloca TBC.[8] [19]

New Taipei Metro fleets

NTMC [/rail/operators/ntmc/]'s own page provides enough evidence for a compact operator roster. The two light-rail fleets share a Taiwan-built five-car platform and total 30 trains, while the Circular Line [/rail/metro/lines/circular-line/] has 17 Hitachi Rail Italy trains.[14] [15] The Sanying [/rail/metro/lines/sanying-line/] fleet is a separate two-car, driverless design with 29 trains, designed by Hitachi Rail and manufactured in Japan.[16]

FLEET FAMILY	QUANTITY AND BUILDER	FIRST-SERVICE CONTEXT	CURRENT LINE / DEPOT EVIDENCE	RENEWAL OR STATUS EVIDENCE [2]
Danhai LRT [/rail/metro/lines/danhai-lrt/]	15 five-car trains; Taiwan Rolling Stock + Voith Engineering Services.[14]	Green Mountain section opened 24 December 2018; Blue Sea phase 1 opened 15 November 2020.[14]	Current line is Danhai; unit-to-depot allocation TBC.[14]	No public unit-level withdrawal or preservation register found.
Ankeng LRT [/rail/metro/lines/ankeng-lrt/]	15 five-car trains; Taiwan Rolling Stock + Voith Engineering Services.[14]	First service 10 February 2023.[17]	Current line is Ankeng, but NTMC records three Ankeng trains at Danhai Depot for compatibility validation in 2025; permanent unit-to-depot allocation is TBC.[18]	The validation movement is retained as an operational event, not treated as a permanent reassignment.[18]
Circular Line	17 trains; Hitachi Rail Italy; steel wheel/rail, third rail and CBTC.[15]	Phase 1 opened 31 January 2020; current operating responsibility changed over time, so the opening operator is not used as a current roster field.[15]	Current line is Circular; unit-to-depot allocation TBC.[15]	No public unit-level withdrawal or preservation register found.
Sanying Line	29 two-car driverless trains; Hitachi Rail design, Japan manufacture.[16]	Revenue opening 30 June 2026.[16]	Current line is Sanying; unit-to-depot allocation TBC.[16]	New fleet; no public unit-level refurbishment, withdrawal or preservation register found.

Why there are no 500 individual stubs

The source record can support useful rows for classes, contract lots, car-number ranges and delivery sequences. It cannot support a truthful page for every set: the missing fields are precisely the fields a roster page would promise — a stable number, current line, current depot, refurbishment state and withdrawal status.[2] [19] [18] A family/lot table therefore keeps the known identifiers visible, marks unit-level gaps as TBC, and can be split into individual pages later if TRTC or NTMC publishes an asset register.

The table also avoids treating procurement purpose as current allocation. DORTS explicitly says connected high-capacity depots can be mutually used, and NTMC's temporary Ankeng-to-Danhai validation movement shows the same problem in an operational release.[19] [18] A line name in a contract column is therefore historical context, not a claim that every train remains there today.

The unresolved items are current unit-to-depot mappings, full serial ranges, unit-level refurbishment histories, withdrawals and preservation. The next primary documents that would settle them are a TRTC 車輛處 asset/stabling register and NTMC procurement handover or vehicle-register records. Until those are fetched, the honest roster is the table above rather than invented precision.
