

# The network

10 lines, 192 stations. 9 of the lines are drawn below from Taiwan MOTC route geometry; the Sanying Line is newer than MOTC's extract, so its 12 stations are outside that station count and it is drawn dashed, as a chain of the operator's published station points rather than as surveyed track. Colours are the official ones each operator publishes — not the values circulating in English-language sources, which are all slightly wrong.

**The Sanying Line is drawn as a chain of station points, not as an alignment.** It opened on 30 June 2026. The New Taipei Metro line records this map is built from carry a source update stamp of 23 May 2023 — nearly three years earlier — and return one line, the Circular Line. There is no LB route geometry to draw. What its dashed line joins is its twelve stations, in the operator's published order, at the New Taipei City landmark register's own coordinates: it states where the stations are and what sequence they run in, and states nothing about the route between them. The line is written up from the operator's own announcement on its line page `[/rail/metro/lines/sanying-line/]`. It *is* in the table below, in its own colour, taken from the operator's LB line mark.

Every line the site carries, each labelled with its code at both ends — colour alone does not identify a line. Bannan blue and Airport MRT purple are indistinguishable to a reader with protanopia, and Tamsui red against Danhai red is the closest pair on the network even in normal colour vision, which is why every line carries its code. Interchange stations are ringed in black; termini are the outer dots. Branch track is drawn as a pale core of its parent's colour inside a hairline of the same colour darkened — a branch belongs to its line rather than being a line of its own, and the hairline is what gives the pale core a defined edge on the paper. 4 lines have one: Tamsui-Xinyi, Songshan-Xindian, Zhonghe-Xinlu and Danhai LRT. Where a line appears broken, the alignment across the gap is missing from the published geometry — those breaks are holes in the source data, not features of the network, and are left unbridged rather than joined with track we cannot evidence. A dashed line is not surveyed track: it joins that line's published station points in order and says nothing about the route between them. Sanying is drawn that way, having no published route geometry at all.

## Lines

**Length is official; Measured is ours.** The operators publish a route length through TDX — as a running total against the last station of each route, not in the route-length field, which is zero throughout. Measured is computed independently from the surveyed geometry, taken between the outermost stations because the published alignment runs on past both termini into depot leads and tail track. The two agree to within about 150 m on every line whose geometry is continuous, which is the point of printing both: the check is visible rather than asserted. Both columns describe the trunk route only, so a line's branch is excluded from each. A ≥ marks a line whose geometry arrives in discontinuous runs — the track crossing each gap is absent from the source, so our figure is a floor, and the shortfall against the official column measures how much is missing: 0.8 km on the Tamsui–Xinyi Line, 2.8 km on the Circular. End-to-end times are MOTC's own.

**A † marks a figure that is not the platform's.** MOTC's data holds no record of the Sanying Line of any kind — not a line record, not a station, not a metre of geometry — so its station count, length and end-to-end time on this table are the operator's own, from New Taipei Metro's own opening announcement, 30 June 2026, and are cited on its line page [/rail/metro/lines/sanying-line/]. The length bar is drawn to the same scale as every other, because a published route length is the same quantity whoever published it; what the dagger marks is that this row was assembled from a different source than the 9 above it, not that it is worth less. Its colour is the operator's too — see the line colours page [/data/line-colours/] for where that was read and what it was checked against.

## Interchanges

18 places where you can change lines. Each carries a different code on each line it serves, which is exactly what the badge system makes legible.
