Technology

The technology layer — signalling, power, guideway and automation — and why Taipei runs several of each.

Taipei operates two incompatible medium-capacity systems, several signalling generations, rubber-tyred and steel-wheel running, and both third-rail and overhead power. Nothing in English explains why, and the answer is mostly history — procurement decisions whose consequences outlived the contracts that made them. The Matra dispute [\[/rail/history/matra-dispute/\]](/rail/history/matra-dispute/) is the opening chapter of that story; this is where the technical threads get their own pages.

Coming: signalling (fixed-block to CBTC, and who supplied what), power supply, guideway families, and automation grades. Each will be written against primary engineering sources, not summarised from encyclopedias.

Three numbering systems on one line

 Wenhua Line

Every Wenhua station has two numbers. On the southern half they run in opposite directions, and the northern half uses a different series again — because the line was built as two projects and a station was added to one of them late.

An independent, non-commercial reference site. Not affiliated with Taipei Rapid Transit Corporation, Taipei City Government, or any bus operator. Line colours are the official values published by each operator through Taiwan MOTC's open data platform. [About this site.](#)

Station names, codes and sequence from TDX Transport Data eXchange, Ministry of Transportation and Communications, operators TRTC, NTMC, and TYMC. Government open data. Retrieved 2026-08-10; source last updated 2020-01-31. The 12 Sanying station records absent from TDX are sourced directly to New Taipei Metro and government publications on their pages. Provenance.
