Maokong Station

The line's upper terminus and namesake — a three-storey rotating-platform building at the centre of the hillside tea-house district, 299 metres up from where the ride began.

MAOKONG STATION			
CHINESE NAME	ADDRESS	OPENED	STRUCTURE
貓空站 ^[1]	臺北市文山區指南里7鄰指南路三段38巷35號 ^[1]	4 July 2007 ^[2]	Elevated, 3 above-ground floors, rotating platform ^[2]

Maokong Station is the gondola's upper terminus, at 指南路三段38巷35號, an elevation of **299.3 metres**^[2] — roughly 275 metres higher than Zoo Station [\[/rail/cable/stations/zoo-station/\]](/rail/cable/stations/zoo-station/) where a rider's trip began. It opened with the rest of the line on 4 July 2007^[2], as the fourth and last of the line's four passenger stations^[3].

Structurally the station is a three-storey elevated building with a rotating-platform design^[2]. The operator's own page describes it as sitting at the centre of the local tea-house district, with storage space built in for cable-car maintenance, and promotes the station itself as a night-view point over greater Taipei [\[/rail/thstr/stations/taipei/\]](/rail/thstr/stations/taipei/) — a claim about the station's own vantage, not the ride itself^[1]. Local bus connections named on the operator's page include the right-hand loop of the Maokong sightseeing bus and routes 小10 and 棕15^[1] — 棕15 is itself one of this project's own researched Brown-line feeder routes, whose own confirmed corridor runs from 富德 up toward this same Maokong tea-house area (see [BR15](#) / 棕15 [\[/bus/routes/colour-brown/brown-15/\]](/bus/routes/colour-brown/brown-15/)).

Siting, access and operations

The operator places Maokong Station at the centre of the hillside tea-house district and identifies storage space for cable-car maintenance within the station site.^[1] That combination makes the terminus both a passenger destination and a working part of the ropeway: the source names maintenance storage, but it does not publish a separate workshop inventory or a capacity figure. Those details remain TBC.^[1]

The same operator page names the Maokong sightseeing bus right-hand loop, 小10 and 棕15 as local connections.^[1] 棕15 is a bus route in this corpus, but the gondola source does not claim an integrated fare or a guaranteed timed connection; the relationship here is therefore a named

access connection, not a timetable promise.^[1] The operator also presents the station as a night-view point over greater Taipei, which is an access and visitor description rather than a measured visibility claim.^[1]

The route-system page places Maokong fourth in the four-station passenger order.^[3] Its upper-terminal role is therefore established by the operator's sequence, while the elevation and rotating-platform description come from the separately cited station record.^{[3] [2]}

When the whole line stops running

The operator's own suspension-criteria page states four automatic triggers that halt the whole line, Maokong Station included, not just this station: sustained wind of 16 m/s (roughly Beaufort force 7) for three or more seconds, or any gust of 18 m/s; any lightning strike within the operating area; an earthquake of intensity 4 or greater; and a land typhoon warning covering the Taipei area, applied according to conditions or a city government work/school closure announcement.^[4] None of these criteria is stated as station-specific — they apply line-wide, and this page states them here because Maokong, as the upper terminus in exposed hillside terrain, is where a rider is most likely to be waiting when one applies.^[4]

Beyond storm-triggered suspensions, the line also closes for planned annual maintenance. A dated example: the Taipei Public Transportation Office recorded a maintenance closure of 5 June and 13 June–1 July 2017, during which the gondola's own sightseeing bus services (to Zhinan Temple and the right-hand loop) were suspended while feeder routes 棕15, 小10 and the left-line-to-Zoo route ran at increased frequency to cover demand.^[5] This dates and sources, with a specific instance, the bus-substitution relationship the operator's own connections list otherwise only states in the abstract.^{[5] [1]}

Specifications

Elevation	299.3 m ^[2]
Station order	of 4 passenger 4 stations (terminus) [3]
