Cable

The Maokong Gondola — an aerial ropeway run by a TRTC subsidiary, and the region's only cable transit.

Lines

The gondola itself — route, stations, cabins and the T16 incident history.

Maokong Gondola

Taipei's first cable car and Taiwan's longest — a TRTC-family ropeway whose T16 tower was undermined by a 2008 typhoon, investigated by the Control Yuan, and rebuilt 30 metres from where it stood.

Stations

The Maokong Gondola's four passenger stations, each researched from the operator's own per-station pages rather than restated from the line article.

Maokong Station

The line's upper terminus and namesake — a three-storey rotating-platform building at the centre of the hillside tea-house district, 299 metres up from where the ride began.

Zhinan Temple Station

A T-shaped elevated station at Zhinan Temple's own rear-mountain car park — one of the two stations directly affected by the 2008–2010 T16 tower closure, since both lie on the closed side of the line.

Zoo South Station

The only one of the gondola's four stations to carry a different name today than the one it opened with — renamed from Zoo Interior Station eight years after opening, which is why the Control Yuan's own 2009 report on this line still calls it by the old name.

Zoo Station

The gondola's lower terminus — a separate structure roughly 350 metres from the Wenhua Line's own Taipei Zoo station, not a shared platform, joined only by an out-of-station transfer.

One system, one line: the Maokong Gondola. It is an aerial ropeway — a POMA installation, not a railway — and it is filed here rather than under its own top-level heading because a heading for a single line is a heading that says nothing. What it shares with the rest of this section is the thing this section is organised by: it runs on its own fixed guideway, to published stations, in a published order, inside the region's stored-value ticketing, and it meets the metro at Taipei Zoo.

The gondola is part of the network in the ways that matter here: metro affiliation, shared ticketing, and a genuine engineering and incident history that English coverage — which is entirely tourist-oriented — has not touched. The story worth telling is the long typhoon closure: a tower foundation undermined, a multi-institute engineering assessment, and a reopening under monitoring. That is the kind of material this site exists for, and it is written against the city's own engineering publications rather than travel blogs.

One of the gondola's cabins, at a station platform.

The line, its cabins — including the glass-floored ones — and the closure history are written up on the Maokong Gondola [\[/rail/cable/lines/maokong-gondola/\]](/rail/cable/lines/maokong-gondola/) page. Each of the four passenger stations now has its own page too, under Stations [\[/rail/cable/stations/\]](/rail/cable/stations/).

Cabins on the span between Taipei Zoo South and Zhinan Temple, a support tower on the ridge at left.
