# The network

9 lines, 180 stations, drawn from Taiwan MOTC route geometry. Colours are the official ones each operator publishes — not the values circulating in English-language sources, which are all slightly wrong.

**The Sanying Line is not drawn.** It opened on 30 June 2026. The New Taipei Metro line records this map is built from carry a source update stamp of 23 May 2023 — nearly three years earlier — and return one line, the Circular Line. Rather than draw an alignment from a dataset that predates the railway, it is absent here and written up from the operator's own announcement on its line page [\[/rail/lines/sanying-line/\]](/rail/lines/sanying-line/).

Every line as surveyed, each labelled with its code at both ends — colour alone does not identify a line. Bannan blue and Airport MRT purple are indistinguishable to a reader with protanopia, and Tamsui red against Danhai red is the closest pair on the network even in normal colour vision, which is why every line carries its code. Interchange stations are ringed in black; termini are the outer dots. Where a line appears broken, the alignment across the gap is missing from the published geometry — those breaks are holes in the source data, not features of the network, and are left unbridged rather than joined with track we cannot evidence.

**Length is official; Measured is ours.** The operators publish a route length through TDX — as a running total against the last station of each route, not in the route-length field, which is zero throughout. Measured is computed independently from the surveyed geometry, taken between the outermost stations because the published alignment runs on past both termini into depot leads and tail track. The two agree to within about 150 m on every line whose geometry is continuous, which is the point of printing both: the check is visible rather than asserted. Both columns describe the trunk route only, so a line's branch is excluded from each. A  $\geq$  marks a line whose geometry arrives in discontinuous runs — the track crossing each gap is absent from the source, so our figure is a floor, and the shortfall against the official column measures how much is missing: 0.8 km on the Tamsui–Xinyi Line, 2.8 km on the Circular. End-to-end times are MOTC's own.

## Interchanges

18 places where you can change lines. Each carries a different code on each line it serves, which is exactly what the badge system makes legible.
